

Project 2 ideas:

Idea 1 — Personal Finance / Budget Tracker

Classes: Transaction and Account. Add income/expenses, categorize them, save the ledger to JSON so it persists between runs, and reload on startup. Functions compute totals, averages, and category breakdowns. Tests verify the math and the save/load round-trip. Strongest all-around fit; looks professional.

Idea 2 — Inventory Management System

Classes: Item (name, quantity, price, SKU) and Inventory that holds items.

Add/remove/update stock, flag low-stock items, save to JSON. Exception handling for removing more than you have or a corrupted file. Tests check stock updates and low-stock detection. Clean OOP, easy to demo.

Idea 3 — Quiz Game 2.0

Re-architect the trivia game to Ch 8–11 standards: Question, Quiz, and Player classes with a saved high-score history in JSON, split into modules (question.py, quiz.py, scoring.py), plus tests for scoring. Great video story about growth from Project 1, but must emphasize it's a genuine re-engineering, not reused work.
